

LANGUAGE AT WORK

WARM-UP: DISCOVERY OF THE TOPIC

WHAT IS IT ABOUT? KEYWORDS & KEY INFORMATION

EXPECTED OUTCOME: USE PROPER TENSES WHEN YOU SPEAK & WRITE

GIVE A PRESENTATION OF YOUR BACKGROUND & FUTURE IN IT & SUCCEED THE QUIZ

WEB AUTHENTICATION

Source: thenextweb.com

1 watch the video & then Listen to the STORY about Web Authentication and list as much information as you can in the form of keywords!

2 Read and answer the questions you will be submitted!

3 Read the following documentation, check vocabulary and answer the questions you will be submitted!

Dumping passwords can improve your security – really?

Security keys, biometrics and a technology called FIDO **are upgrading** today's feeble security foundation. Passwords suck.

They're hard to remember, hackers **exploit** their weaknesses and **fixes** often bring their own problems. Dashlane, LastPass, 1Password and other password managers generate strong and unique passwords for every account you have, but the software is complex. Services from Google, Facebook and Apple allow you to use your passwords for their services at other sites, but you have to give them even more power over your life online. Two-factor authentication requires a second passcode. It **is sent** by text message or **retrieved** from a special app each time you log in, boosts security dramatically but **can** still **be defeated**.

A big change, however, **could eliminate** passwords altogether. The technology, called FIDO, overhauls the log-in process, combining your phone; face and fingerprint recognition; and new gadgets called hardware security keys. If it delivers on its promise, FIDO **will make** cringeworthy passwords like "123456" relics of a bygone age.

"A password is something you know. A device is something you have. Biometrics is something you are," **said** Stephen Cox, chief security architect of SecureAuth. "We're moving to something you have and something you are." [...]
